Where I'd invest in 2027

My view after mapping 69 Greek deep tech startups. This is my own opinion and not investment advice.

My view in short

I spent the last few weeks building a map of Greek deep tech startups and one thing kept coming up. Greek seed funds are good at finding technical teams early, but very few of these companies raise a Series A while staying based in Greece. Out of the 16 companies on my map that reached Series A or later, only 3 have their headquarters here. At the same time the state and the EU are putting real money into defense, space and energy. So in 2027 I would look for teams that already have a Greek seed round, a paying public or industrial customer, and a good reason to keep growing in Greece.

Where I would put money

1. Robot software and sensors

   Acumino raised $11.7M at seed in June 2026 and was picked for Google DeepMind's first European robotics accelerator. Progressive Robotics and Terra Robotics in Thessaloniki, Bota Systems and Robenso are all still at seed. I prefer software and sensors over full robots because they need less money. What could go wrong: most of these teams are young and they will probably need a foreign investor to lead their Series A.

2. Defense and dual use autonomy

   Delian Alliance Industries raised a $14M Series A in July 2025 with Air Street and Marathon, and Mind The Hack raised €2.8M in October 2025. My map has at least five Greek drone makers with no disclosed venture round, and EFA Group has already invested in two of them. I would look at the companies that supply parts and software to these drone makers. What could go wrong: selling to governments takes a long time.

3. Health and biotech software

   Health and biotech is one of the two biggest groups on my map with 13 companies, like ORamaVR ($4.5M in January 2026), Intelligencia, Causaly and Brainomix. Kos Biotechnology Partners reached $123M for its first life sciences fund (reported in June 2026). I would choose software and medical devices over new drugs, because developing a drug needs much more money than Greek funds can give.

Where I would wait

- Quantum. I found only one company, QRBIT, a 2025 spinout from NTUA, and no venture round yet. For now I would follow the university spinouts and the ESA BIC Greece incubator.
- Space. Greece is spending €350M on its Hellas Space 2.0 program, but the biggest space deals so far went to foreign companies with Greek offices, like Open Cosmos and OQ Technology. I would wait for Greek teams like EMTech Space to raise real rounds first.
- Simple AI apps. There are a lot of seed stage AI apps and without revenue numbers it is hard to tell which ones will last.

What I want to check next

- Whether Axelera AI has a real team in Greece beyond its Greek cofounder and CTO.
- Which foreign investors keep leading Greek Series A rounds (Air Street, Molten and 8VC show up in my data).
- Phase 2: a tracker for hiring, funding news and GitHub activity across these 69 companies.
