Where I'd invest in 2027

Thesis draft for Greek deep tech. An opinion built on the dataset, not a recommendation to buy anything.

The view in one paragraph

Greek seed funds are finding and backing technical teams; the thin part is the step after seed, and the demand side (defense, space, energy, health systems) is growing faster than local venture-backed supply. I would look for companies that sit where Greek capital, Greek engineering talent and a funded public or industrial buyer overlap, and that need a Series A rather than another seed.

Three bets

1. Physical AI and robot components (software and sensors, not whole robots).

   Evidence: Acumino raised USD 11.7M seed (June 2026) and joined Google DeepMind's robotics accelerator; Progressive Robotics and Terra Robotics (laser weeding, about EUR 1.8M seed, Uni.Fund-led, 2025) in Thessaloniki, Bota Systems and Robenso are all seed stage; Gizelis Robotics is a local integrator with no external funding found. What would make it work: a Series A lead from outside Greece and an industrial pilot customer. Risk: most teams are one or two rounds old.

2. Dual-use and defense autonomy.

   Evidence: Delian Alliance Industries (USD 14M Series A, July 2025, Air Street and Marathon); Mind The Hack (EUR 2.8M seed, Oct 2025); five drone makers with no disclosed venture round (EFA Group invests in two); EUR 350M Hellas-Space 2.0 as a sign of public demand. The opening is component and software suppliers to those drone makers, and a second Delian-type company. Risk: long procurement cycles (my assumption, not in the dataset).

3. Computational health and biotech tooling.

   Evidence: Health & Biotech is the second-largest box (12 names; Robotics has 13): ORamaVR (USD 4.5M, Jan 2026), Intelligencia, Causaly, Brainomix, Anacalypsis (first Greek VC investment in homegrown drug discovery per Metavallon). New local capital (Kos, USD 123M, reported June 2026) should lift Series A options. Risk: wet-lab biotech is capital-heavy; I would favor software and instruments over therapeutics at this stage.

Where I would not rush

- Quantum: the dataset has no verified venture-backed Greek company. I would track university spinouts through Metavallon's Brain Gain fund and revisit, rather than force a thesis.
- Pure application-layer AI: the AI box is full of seed-stage apps (Moveo.AI, Bitloops, Keragon). Differentiation is hard to see without product or revenue data this dataset does not hold.

What I would check next

- Confirm whether Axelera AI has any Greek team beyond its CTO and remote hires: if so, semiconductors is the strongest talent story; if not, the box stays thin.
- Find the Series A and B investors who actually follow Greek seed rounds (Air Street, Molten, 8VC appear) and map their criteria.
- Phase 2 tracker: hiring, funding news and GitHub activity for the 61 mapped names, starting with the robotics and defense groups.
